JUNE · IAS 2026 · CLASS 13

Editing the Talk

Ten minutes. The whole paper. Twelve decisions nobody has made yet — we make them today.

INTRODUCTION

Why should an ankle room care about the core?

How does the talk open — the first sentence?

A

Start with the number — 40% of first sprains become chronic

B

Start with the moment — landing is where it goes wrong

C

Start with the puzzle — an ankle problem, but the answer may sit above the ankle

FROM THE PAPER

up to 40% → CAI

deficits most visible in landing

proximal stability for distal mobility

BRIAN, HONESTLY *Which one would make you look up from your phone?*

WE SAY

The gap, in one sentence

A

Nobody has compared foot core and trunk core training directly

B

We don't know if balance gains show up when you actually land

C

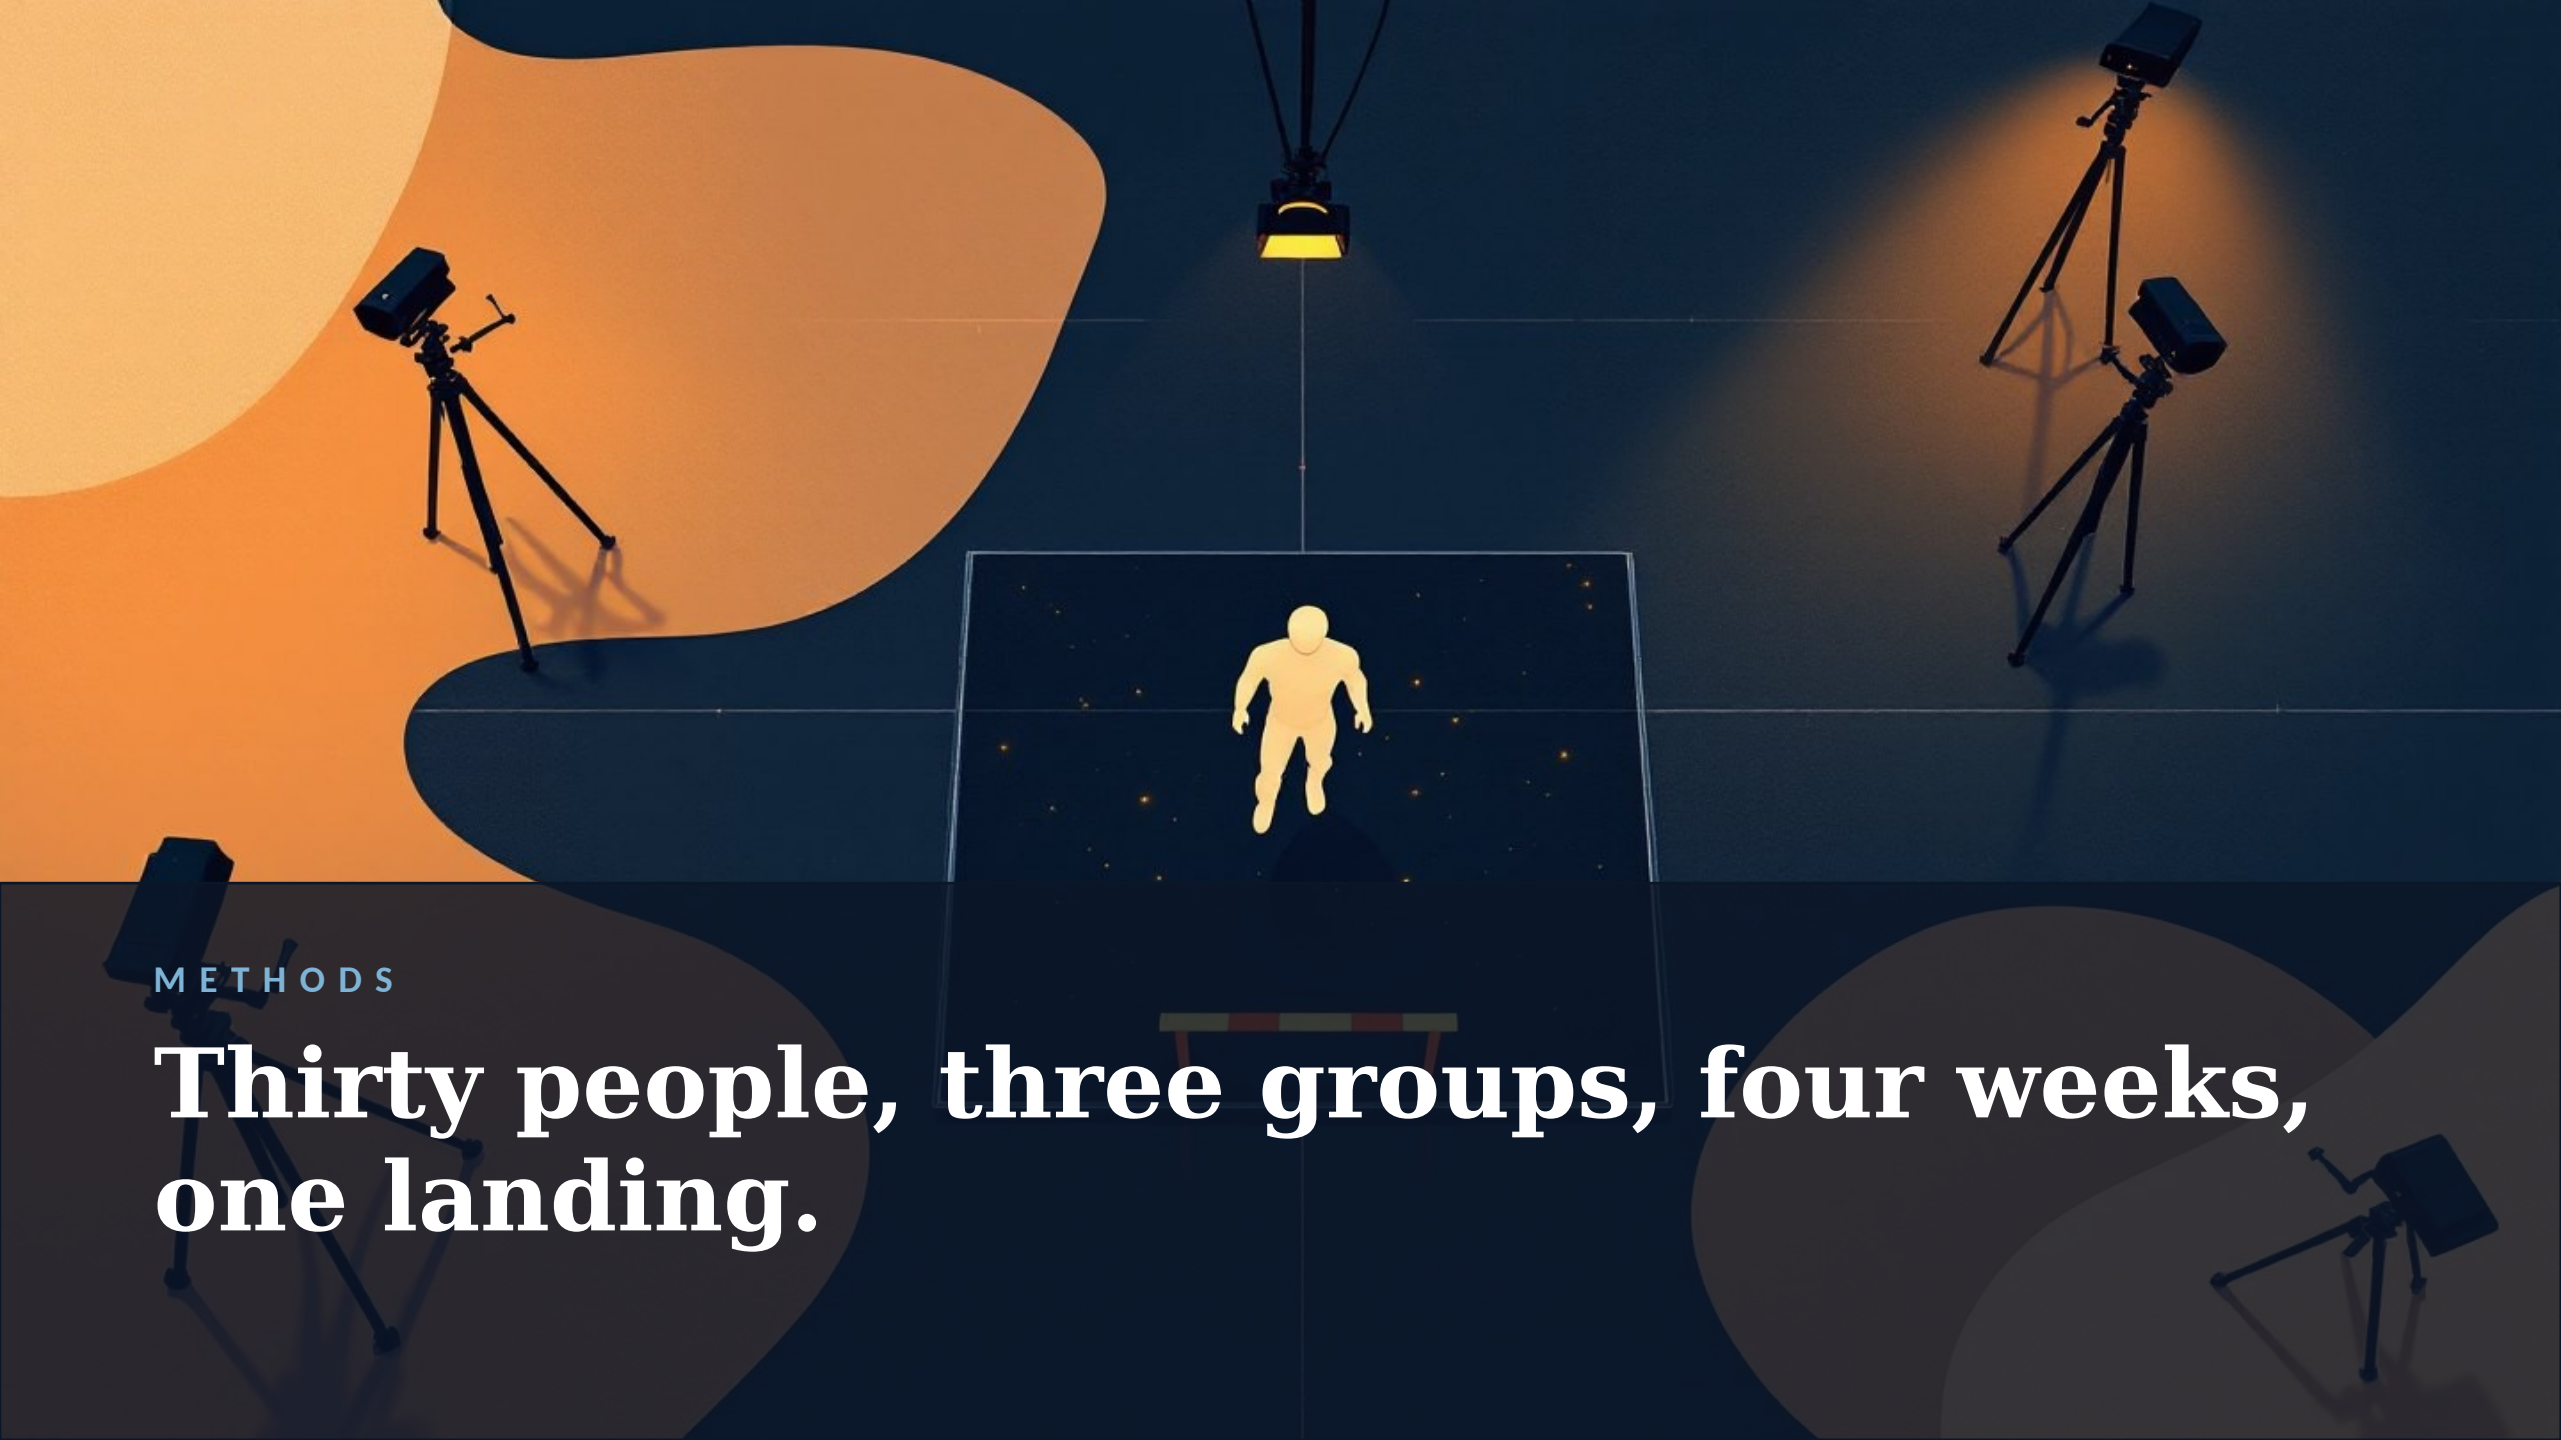

Both — but which one comes first?

FROM THE PAPER

- FCT and TCT each improve postural control
- carry-over to landing: unknown
- bottom-up vs top-down: rarely compared

BRIAN, HONESTLY *If June says only one of these, which one do you remember?*

WE SAY

METHODS

Thirty people, three groups, four weeks, one landing.

Which numbers survive the 60-second Methods slide?

A

Keep 30 / 3 groups / 4 weeks / 12 sessions — nothing else

B

The above + what the landing task looks like

C

The above + the 200-ms window, because the result lives there

FROM THE PAPER

30 participants · 10/group · stratified by sex

3×/week · 12 sessions · ~30 min

hurdle 30 cm · from 40% height · single-leg landing

Vicon 35 markers · IC > 20 N · first 200 ms

BRIAN, HONESTLY *Which number did you forget first?*

WE SAY

How do we show two training programs on one slide?

A

Two columns, five exercise names each

B

Two columns, two names each + one photo

C

One line: foot muscles vs deep trunk muscles — same dose

FROM THE PAPER

FCG: short-foot, towel curls… | TCG: drawing-in, planks… | both progressive · CG: nothing

BRIAN, HONESTLY *Would a clinician want the exercise names, or the idea?*

WE SAY

RESULTS

Balance didn't change. The trunk did.

Order: lead with what didn't change, or with what did?

A

Null first — 'Balance didn't change... but something else did'

B

Trunk first — 'Foot core training changed the trunk', then the nulls

C

Side by side, one slide

FROM THE PAPER

no interaction: any balance outcome

no interaction: ankle · knee · hip

trunk interaction: IC p = .016 · peak p = .004

BRIAN, HONESTLY *Which order keeps you listening?*

WE SAY

How do we say the null results without sounding like a failure?

A

'Balance measures were not sensitive to four weeks of training'

B

'All three groups changed similarly in balance — training didn't add to it'

C

'The ankle itself didn't move differently. The trunk did.'

FROM THE PAPER

time effect only: EC ellipse area p = .046

everyone changed: ankle & hip rotation at IC

nothing training-specific below the trunk

BRIAN, HONESTLY *Does any of these sound like an excuse?*

WE SAY

The trunk finding — how precisely do we state it?

A

'Foot core training reduced trunk rotation' — simple, slightly over-claims

B

'...reduced trunk rotation compared with trunk core training' — exact

C

'Rotation went down with foot core and up with trunk core' — both directions

FROM THE PAPER

- IC: FCG −2.59° · TCG +4.04° · CG +1.40°
- FCG vs TCG p = .014 (IC) · p = .004 (peak)
- FCG vs CG p = .224 (IC) · p = .053 (peak)
- TCG vs CG: no difference

BRIAN, HONESTLY *If a reviewer hears option A, what do they ask?*

WE SAY

Figures: one or both, and what do we point at?

A

Figure 1 only — the shape tells the story

B

Figure 2 only — it shows who differs from whom

C

Both, twenty seconds each

FROM THE PAPER

Fig 1: SPM interaction across 0–100%, p = .010

Fig 2: FCG vs TCG 25–100% · FCG vs CG 80–100%

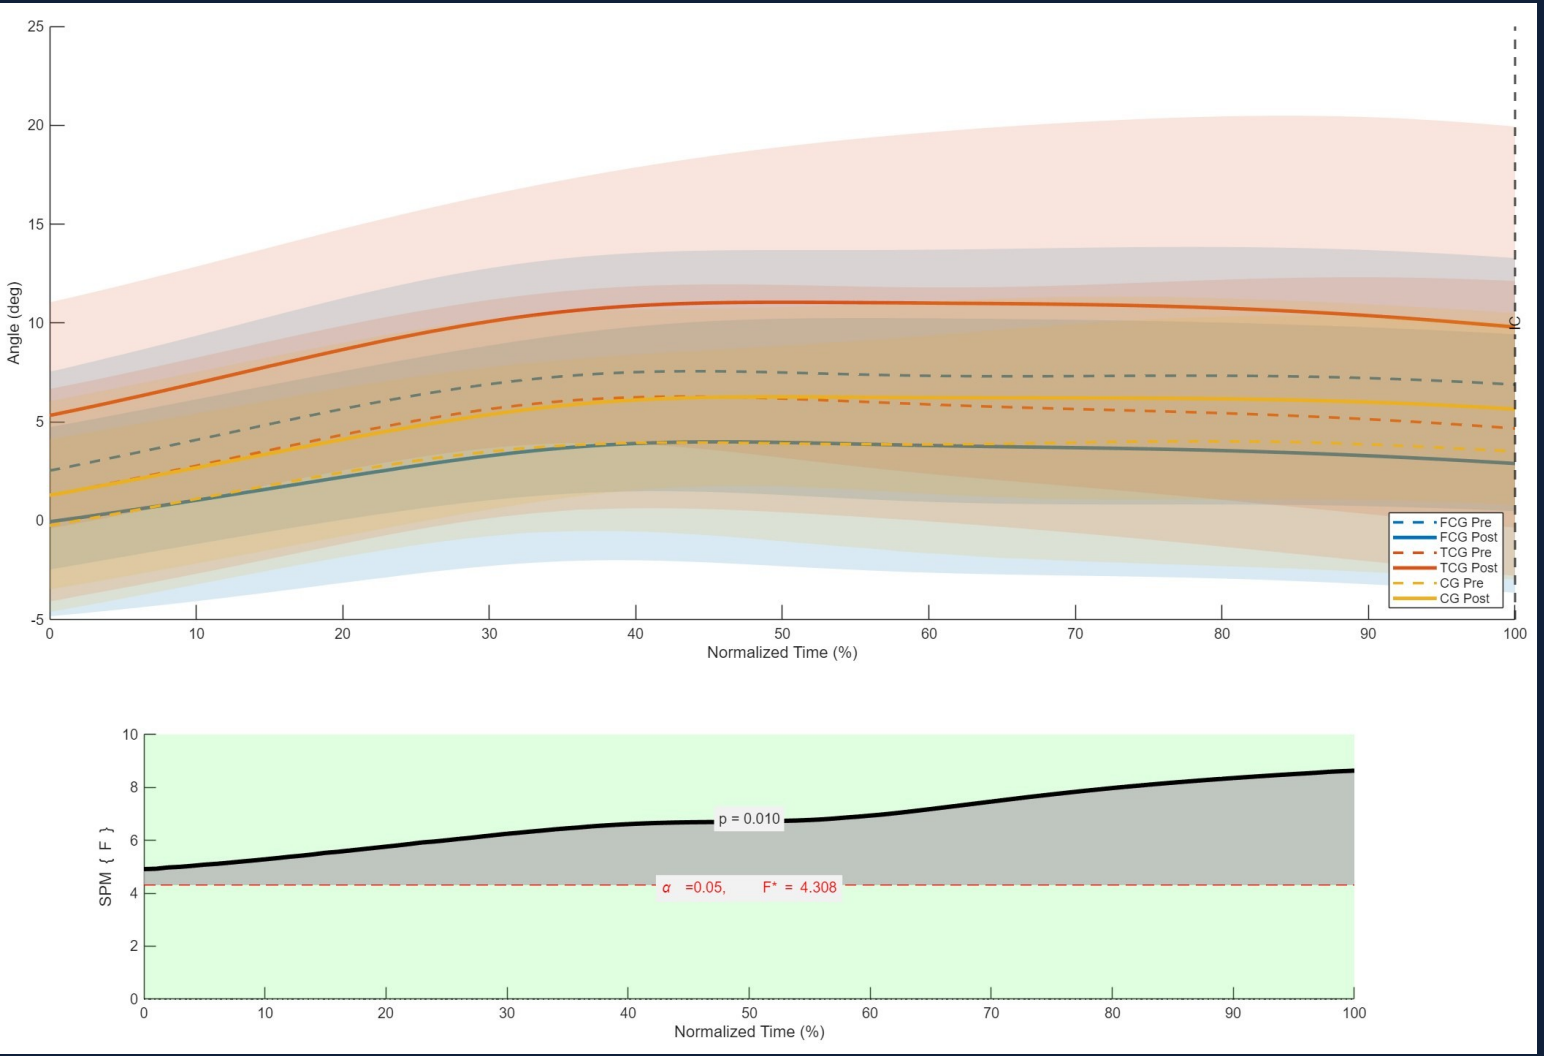

audience: clinicians · projector · 10 min

BRIAN, HONESTLY *Look at both. Which one did you understand without June explaining?*

WE SAY

FIGURE 1

Mean trunk transverse-plane angle + SPM interaction (p = 0.010)

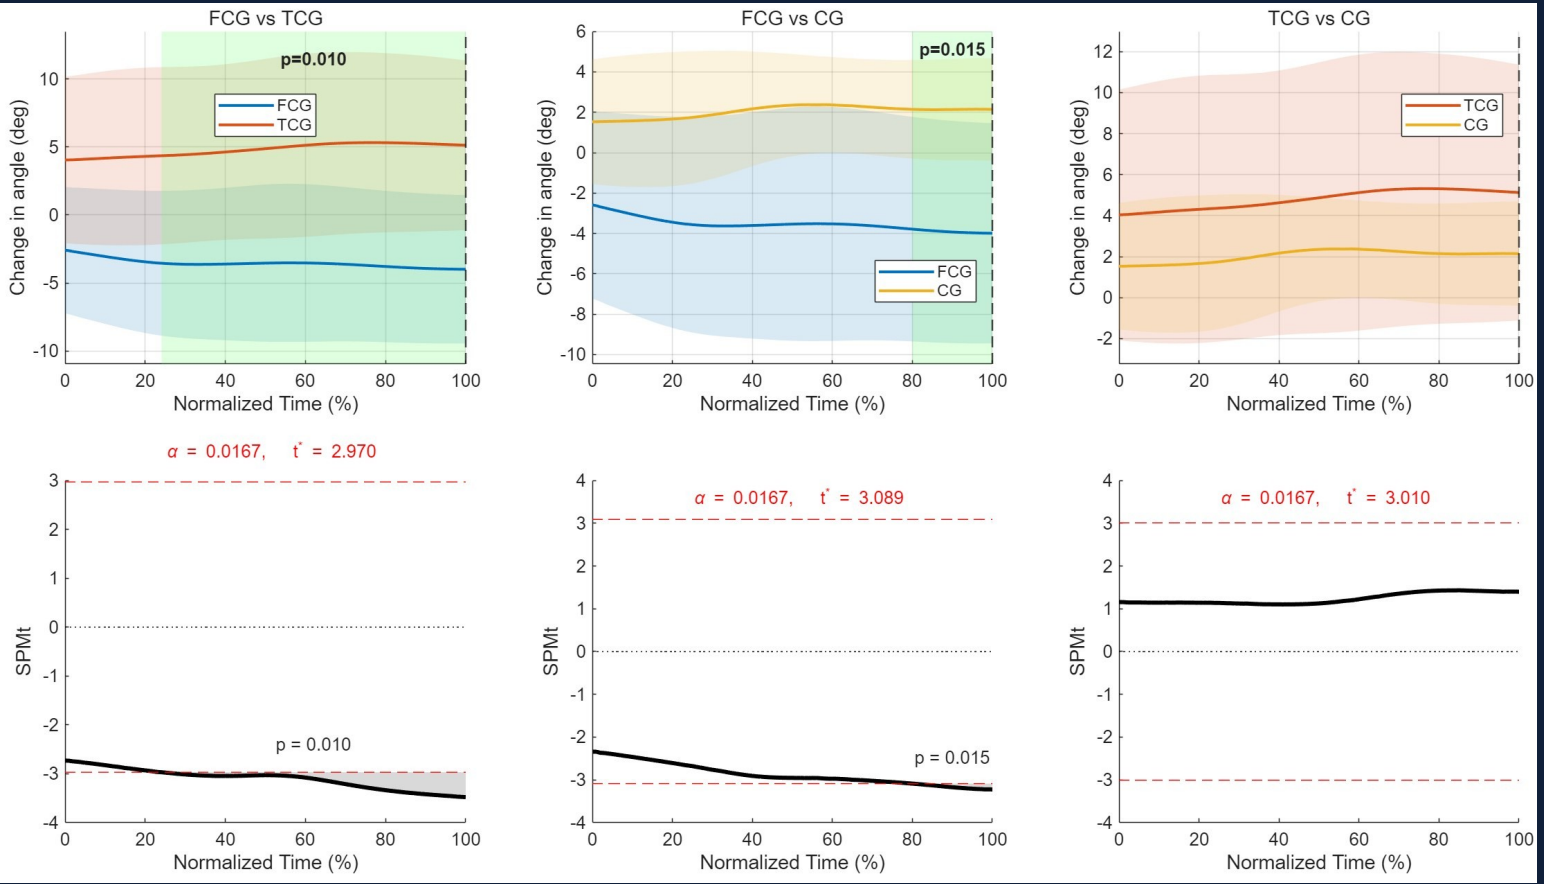

WHAT TO POINT AT

- Dashed = pre, solid = post
- FCG solid sits lower than dashed — rotation went down
- TCG moves the other way
- Shaded: significant across the whole 0–100%
- Say: 'the whole landing window, not one moment'

FIGURE 2

Post-hoc change waveforms (post minus pre)

WHAT TO POINT AT

- Negative = toward contralateral rotation
- FCG vs TCG: shaded 25% → 100%
- FCG vs CG: shaded only at the end, 80% → 100%
- TCG vs CG: nothing
- Say the two shaded panels, skip the third

SPM in twenty seconds

A

Don't explain it — just say 'across the whole landing window'

B

One sentence: 'ANOVA looks at two moments; SPM looks at the whole curve'

C

Skip the method — show the shaded region and let it speak

FROM THE PAPER

ANOVA: single points (IC, peak)

SPM: whole 200-ms curve

here they agree

BRIAN, HONESTLY *After hearing it once, can you say what SPM does?*

WE SAY

DISCUSSION

Not written yet. We decide the claim today.

Why would foot training change the trunk — and how hard do we claim it?

A

Strong — 'A stable foot gives the trunk less to correct'

B

Careful — 'One possibility is that…' mechanism as hypothesis

C

Honest-first — say what we didn't see (no ankle/knee/hip change), then the hypothesis

FROM THE PAPER

- foot core = base of the chain (McKeon)
- no change at ankle · knee · hip
- effect vs TCG; vs CG p = .053

BRIAN, HONESTLY *Which version would you believe from a stranger?*

WE SAY

Limitations: one up front, the rest in your pocket

A

'Four weeks, ten per group — a signal, not a verdict'

B

'No sham control, so attention could play a role'

C

'We saw the trunk change but not the path to it'

FROM THE PAPER

4 weeks · no follow-up | n = 10 per group | control did nothing | lab landing · one height · one direction

BRIAN, HONESTLY *Which limitation would you have raised yourself?*

WE SAY

CONCLUSION

What can a clinician try on Monday?

The last line

A

'Add foot core work to CAI rehab — it may change how patients land'

B

'If you only have four weeks, start at the foot'

C

'Balance tests may miss what the trunk is doing — look at landing'

FROM THE PAPER

abstract: FCT reduced trunk rotation during landing

abstract: may modify altered landing patterns

practical implications: not written yet

BRIAN, HONESTLY *Which one would you repeat to a colleague tomorrow?*
